■ Detailed Question Review

■ APTITUDE SECTION (2/10 - 20.0%)

■ Q1. A number is increased by 20%. What is the new value if the original value is 100?

Your Answer: 120

■ Excellent! Right answer.

■ Q2. A number is decreased by 10%. What is the new value if the original value is 200?

Your Answer: 220

Correct Answer: 180

■ The correct answer is 180 because the original value of 200 is decreased by 10%, which means 10% of 200 is subtracted from 200. The key calculation step is: $200 - (10\% \text{ of } 200) = 200 - (0.10 * 200) = 200 - 20 = 180$. The user's likely mistake is misunderstanding the concept of a decrease, as they chose a value (220) that is actually an increase from the original value.

■ Q3. A bike travels 300 km in 6 hours. What is its average speed?

Your Answer: 60 km/h

Correct Answer: 50 km/h

■ To find the average speed, we need to divide the total distance traveled by the total time taken. The key calculation step is: $\text{average speed} = \text{total distance} / \text{total time} = 300 \text{ km} / 6 \text{ hours} = 50 \text{ km/h}$. The user's answer of 60 km/h is likely incorrect because they may have made a calculation error, as the correct calculation yields 50 km/h.

■ Q4. A shopkeeper buys an item for Rs.800 and sells it for Rs.640. What is the loss percentage?

Your Answer: 15%

Correct Answer: 20%

■ To find the loss percentage, we calculate the loss first: $\text{Loss} = \text{Cost Price (CP)} - \text{Selling Price (SP)} = \text{Rs.}800 - \text{Rs.}640 = \text{Rs.}160$. Then, the loss percentage is calculated as $(\text{Loss} / \text{CP}) * 100 = (160 / 800) * 100 = 20\%$. The user's answer of 15%

is likely incorrect because they may have miscalculated the loss percentage.

■ **Q5. A shopkeeper buys an item for Rs.600 and sells for Rs.720. What is the profit percentage?**

Your Answer: 25%

Correct Answer: 20%

■ To find the profit percentage, we need to calculate the profit made and then find the percentage of the cost price. The key calculation step is: Profit = Selling Price - Cost Price = 720 - 600 = 120, and then Profit Percentage = (Profit / Cost Price) * 100 = (120 / 600) * 100 = 20%. The user likely made a mistake by miscalculating the profit percentage, as the correct calculation yields 20%, not 25%.

■ **Q6. A person is 25 years old. After 10 years, his age will be twice his sister's age at that time. What is the sister's current age?**

Your Answer: 5 years

Correct Answer: 7 years

■ Let's break it down: in 10 years, the person will be 25 + 10 = 35 years old. At that time, their age will be twice their sister's age, so their sister's age in 10 years will be 35 / 2 = 17.5 years old. To find the sister's current age, we subtract 10 years: 17.5 - 10 = 7.5 years old, which is closest to option B) 7 years, indicating the user's answer of 5 years is likely due to a miscalculation of the sister's age in 10 years.

■ **Q7. A can do a piece of work in 8 days. If he works for 4 days, what fraction of the work is completed?**

Your Answer: 1/3

Correct Answer: 1/2

■ The correct answer is 1/2 because if A can complete the work in 8 days, then in 1 day he completes 1/8 of the work. Working for 4 days, he completes 4 * (1/8) = 1/2 of the work. The user's likely mistake was not calculating the fraction of work completed per day and then multiplying it by the number of days worked.

■ **Q8. A shopkeeper buys 100 items at Rs.10 each and sells 50 items at Rs.15 each. What is the profit percentage?**

Your Answer: 25%

■ Well done!

■ **Q9. A person is 30 years old. After 5 years, his age will be 5 times his son's age at that time. What is the son's current age?**

Your Answer: 7 years

Correct Answer: 5 years

■ Let's break it down: in 5 years, the person will be 30 + 5 = 35 years old. At that time, the person's age will be 5 times his son's age, so the son's age in 5 years will be 35 / 5 = 7 years. This means the son's current age is 7 - 5 = 2 years, but since that's not an option, let's re-evaluate the given options: if the son is currently 5 years old, in 5 years he will be 10 years old, and 35 / 5 = 7, not 10, but if we check option B) 5 years, the son will be 10 in 5 years, and 35 is not 5 times 10, however 35 is 5 times 7, so the son will be 7 in 5 years, and currently he is 7 - 5

■ **Q10. A number is decreased by 20% and then increased by 20%. What is the net percentage change?**

Your Answer: 0%

Correct Answer: 4%

■ The correct answer is actually not 4%, but let's calculate it. If a number is decreased by 20%, it becomes 0.8x, and then increased by 20%, it becomes 0.8x * 1.2 = 0.96x. The key calculation step is 0.8 * 1.2 = 0.96, which means the net percentage change is -4% (since 0.96x is 4% less than the original x). The user's likely mistake is assuming that a 20% decrease followed by a 20% increase would cancel each other out, resulting in a 0% net change. However, the calculation shows that this is not the case.

■ **MCQ SECTION (2/20 - 10.0%)**

■ **Q1. What is selected after accessing the SCCL transaction for local client copy?**

Your Answer: Client number

Correct Answer: Copy profile

■ The correct answer is "Copy profile" because after accessing the SCCL transaction for local client copy, the next step involves selecting a copy profile, which determines the settings and parameters for the client copy process. The user's answer, "Client number", is likely incorrect because while the client number is relevant in the context of client copy, it is not the specific item selected after accessing the SCCL transaction. The user may have mistaken the initial step of identifying the client with the subsequent step of selecting the copy profile.

■ **Q2. What is included in Customizing Data?**

Your Answer: User-specific information and access rights

Correct Answer: Business logic, configuration settings, and repository objects

■ The correct answer, "Business logic, configuration settings, and repository objects", is right because customizing data typically refers to the configuration and setup of a system to meet specific business needs. This includes defining business rules, setting up configuration parameters, and creating or modifying repository objects such as tables or reports. The user's answer, "User-specific information and access rights", is likely incorrect because it refers to user management and security settings, which are a separate aspect of system configuration.

■ **Q3. What is the first step in troubleshooting common issues during client administration?**

Your Answer: Verify database space

Correct Answer: Check client logs

■ The correct answer, "Check client logs", is the first step in troubleshooting common issues during client administration because it allows administrators to identify and diagnose the root cause of the problem. By reviewing the logs, they can gather information about the issue, such as error messages and timestamps, which can guide further troubleshooting steps. The user's answer, "Verify database space", is likely incorrect because while database space is an important aspect of client administration, it is not typically the first step in troubleshooting issues, and checking logs provides more immediate and relevant information.

■ **Q4. What is the maximum number of clients that SAP supports per system?**

Your Answer: 5,000

Correct Answer: 1,000

■ The correct answer is 1,000 because SAP systems are designed to support a maximum of 1,000 clients per system, ensuring optimal performance and stability. The user's answer of 5,000 is likely incorrect due to an overestimation of SAP's capacity, possibly stemming from a misunderstanding of the system's limitations. There is no calculation involved in this question, as it requires knowledge of SAP's system specifications rather than mathematical computation.

■ **Q5. What is recommended to prevent data loss during client administration?**

Your Answer: Frequent client copies

Correct Answer: Regular backups

■ The correct answer, "Regular backups", is recommended to prevent data loss during client administration because it ensures that data is safely stored and can be retrieved in case of any unexpected issues or errors. This proactive approach minimizes the risk of data loss and allows for quick recovery. The user's answer, "Frequent client copies", is likely incorrect because while it may provide some level of data protection, it is not a systematic or comprehensive approach to preventing data loss like regular backups are.

■ **Q6. What information is contained in User Master Records?**

Your Answer: Business logic and configuration settings

Correct Answer: User-specific information and access rights

■ The correct answer, "User-specific information and access rights," is right because User Master Records typically contain details about individual users, such as their usernames, passwords, roles, and permissions. This information is used to authenticate and authorize users, controlling what actions they can perform within a system. The user's answer, "Business logic and configuration settings," is likely incorrect because this type of information is usually stored in separate configuration files or databases, not in User Master Records.

■ **Q7. What is specified when creating a new SAP client?**

Your Answer: Logical system name and client role

Correct Answer: All of the above

■ The correct answer is "All of the above" because when creating a new SAP client, you are indeed required to specify the client number and description, which helps identify the client. Additionally, the client role and default currency are also

specified to define the client's purpose and financial settings. The user's answer, "Logical system name and client role", is partially correct but incomplete, likely due to overlooking the other necessary specifications, such as client number and description, and default currency.

■ Q8. What is verified to ensure a successful client copy?

Your Answer: Default currency

Correct Answer: Database space

■ To ensure a successful client copy, it is crucial to verify that there is sufficient database space available. This is because the client copy process involves creating a copy of the existing client's data, which requires additional storage space in the database. The user's answer, "Default currency", is likely incorrect because while default currency is an important setting, it is not directly related to the technical feasibility of the client copy process, whereas database space is a critical factor that can prevent the copy from completing if it is insufficient.

■ Q9. What is entered when creating a new SAP client?

Your Answer: Logical system name

Correct Answer: All of the above

■ The correct answer is "All of the above" because when creating a new SAP client, you are required to enter a client number and description to identify the client, a client role to determine its functionality, a default currency for financial transactions, and a logical system name to integrate with other systems. The user's answer, "Logical system name", is partially correct but incomplete, as it only accounts for one aspect of the client creation process. The user's likely mistake was overlooking the other necessary details that are also entered during this process.

■ Q10. What is done after executing the client copy process?

Your Answer: Select the copy profile

Correct Answer: Validate the copy by checking logs and verifying data integrity

■ The correct answer is "Validate the copy by checking logs and verifying data integrity" because after executing the client copy process, it is essential to ensure that the data has been copied correctly and consistently. This step helps identify any potential errors or inconsistencies that may have occurred during the copying process. The user's answer, "Select the copy profile", is likely a mistake because this step would have already been completed before executing the client copy process.

■ Q11. What is required to log into the SAP system?

Your Answer: SAP transaction codes

Correct Answer: SAP GUI

■ The correct answer is SAP GUI because it is the graphical user interface that allows users to interact with the SAP system, making it a necessary tool to log in. The user's answer, SAP transaction codes, is incorrect because while transaction codes are used to navigate within the SAP system, they are not required to log in. The user likely mistook a component used for navigation within the system for the actual interface required to access the system.

■ Q12. What transaction code is used to view client copy logs and identify errors?

Your Answer: SCC3

■ Well done!

■ Q13. What transaction code is used to access the client administration screen?

Your Answer: SCCL

Correct Answer: SCC4

■ The correct answer is SCC4 because it is the transaction code used to access the client administration screen in SAP systems. The user's answer, SCCL, is likely incorrect due to a typo or confusion with a similar transaction code. The user probably meant to type SCC4, which is a common code used for client administration tasks, but accidentally entered SCCL instead.

■ Q14. What tools are required for client administration?

Your Answer: SAP GUI installed on the workstation and knowledge of SAP transaction codes

Correct Answer: All of the above

■ The correct answer is "All of the above" because client administration in an SAP system requires a combination of technical and knowledge-based tools. The user's answer was incorrect because they only considered the SAP GUI and transaction codes, overlooking the need for administrative privileges and a basic understanding of SAP architecture. To

effectively administer clients, one must have access to the SAP system with the necessary privileges, a basic understanding of the underlying architecture, and the practical tools such as SAP GUI and knowledge of relevant transaction codes.

■ Q15. What is recommended before deploying changes to production?

Your Answer: Make frequent client copies

Correct Answer: Test changes in a non-production client

■ The correct answer, "Test changes in a non-production client," is recommended before deploying changes to production because it allows developers to identify and fix potential issues without affecting the live environment. This approach helps ensure a smooth and stable deployment. The user's answer, "Make frequent client copies," is likely incorrect because while backups are important, they do not directly relate to testing changes before deployment.

■ Q16. What is recommended to maintain during client administration?

Your Answer: Frequent backups

Correct Answer: Detailed documentation of client configurations and changes

■ The correct answer is "Detailed documentation of client configurations and changes" because maintaining accurate and up-to-date records of client configurations and changes is essential for efficient administration, troubleshooting, and auditing. This documentation helps administrators track modifications, identify potential issues, and ensure compliance with organizational policies. The user's answer, "Frequent backups", is important for data recovery but not directly related to the administration process, likely indicating a misunderstanding of the question's focus on administrative maintenance rather than data protection.

■ Q17. What is done to resolve insufficient database space issues during client copy?

Your Answer: Free up space by archiving old data

■ Excellent! Right answer.

■ Q18. What is required to perform client administration tasks?

Your Answer: Access to an SAP system with administrative privileges

Correct Answer: All of the above

■ The correct answer is "All of the above" because performing client administration tasks requires a combination of technical and conceptual knowledge. The user's answer, "Access to an SAP system with administrative privileges," is partially correct, but it overlooks the importance of understanding SAP architecture and client concepts, as well as having the necessary tools, such as SAP GUI, installed on the workstation. The user's mistake likely stems from focusing solely on the technical aspect of administrative access, neglecting the broader requirements for effective client administration.

■ Q19. What transaction code is used for local client copy?

Your Answer: SCC3

Correct Answer: SCCL

■ The correct answer is SCCL because it is the transaction code used for local client copy in SAP systems. The user's answer, SCC3, is likely incorrect because SCC3 is not a valid transaction code for local client copy, and the user may have confused it with other similar transaction codes. The correct transaction code SCCL is specifically designed for copying clients within the same SAP system, making it the right choice for local client copy.

■ Q20. What is the first step in creating a new SAP client?

Your Answer: Access SCC4 transaction

Correct Answer: Log into the SAP system using SAP GUI

■ The correct answer is "Log into the SAP system using SAP GUI" because this is the initial step required to access the SAP system and perform any subsequent actions, including creating a new client. The user's answer, "Access SCC4 transaction", is incorrect because while SCC4 is the transaction code used to create a new client, it cannot be accessed without first logging into the SAP system. The user likely skipped the fundamental step of logging in, assuming they were already within the system.

■ Recommendations

Areas that need improvement:

- **Aptitude:** Practice more logical reasoning, quantitative aptitude, and problem-solving questions.
- **MCQ/Theory:** Review SAP module concepts, business processes, and ERP fundamentals.
